Industry

ISP RAS was founded on January 25, 1994

240 employeers: 60 Ph.D.and 15 Professors3 departments ofMSU, MIPT, HSE

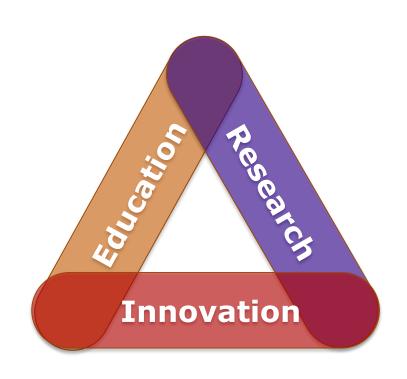

Ecosystem of ISP RAS is based on the knowledge triangle

Research-oriented education

Academician & Industrial Advanced Research

Innovation via companies

Long term cooperation with industrial partners: HPE, Samsung, Dell, Nvidia, Klocwork (now – RogueWave), etc.

ISPRAS: compilers and HPC direction

- ☐ GCC optimizations:
 - ✓ New aggressive scheduler with register renaming/speculation/predication support and software pipelining support (4% improvement on SPEC FP 2000 on IA-64)
 - ✓ GCC Modulo Scheduling improvements
 - ✓ Propagating alias information to the machine dependent optimizations
 (jointly with Richard Guenther from SuSE)
- □ Natural language processing tools for Taming Information Explosion (Texterra) and Semi-automatic data extraction from tables
- HPC direction and cluster's installations:
 - ✓ National Academy of Sciences of the Republic of Armenia (the most powerful on Caucasian region);
 - ✓ Oil company «LUKOIL»;
 - ✓ Moscow Institute of Physics and Technology (29 edition Top500);
 - ✓ Vyatka State University (30 edition Top500);
 - ✓ North-Eastern Federal University in Yakutsk (the most powerful on Far East region of Russia)
- We represented RAS in global technical communities initiated by HPE: Gelato, OpenCirrus

University Cluster program

Founders:

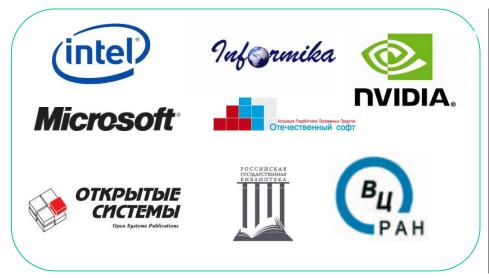

- > Founded in 2008
- ➤ ISP RAS is Competence Center
- Technologies and education in parallel and distributed programming
- Creating technology specific web-laboratories
- > Transfer of knowledge into Russian industry

Partners:

Technological platform of "University Cluster" program

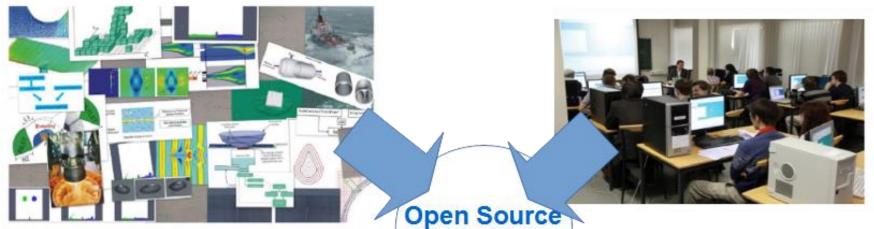

UniHUB* – OpenStack-based platform for creating problem-oriented web-labs:

- ☐ Users collaboration (webinars, wiki, trainings, forum, animated presentations, uploading and sharing materials, statistics and user feedback)
- Simulation tools delivered to browser
- ☐ Software development (IDE, source code control, bug tracking)

OpenStack, SPICE, Apache, Joomla, MediaWiki, FUDforum, Openqwaq, MOOC, Eclipse, Git, Bugzilla, MongoDB, RabbitMQ, Globus Toolkit, Slurm, Python.

^{*}Availability – 24/7 (Data Center of CC RAS – former Yandex)

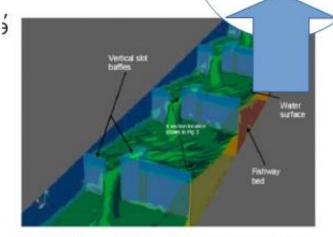

OpenSource: OpenFOAM

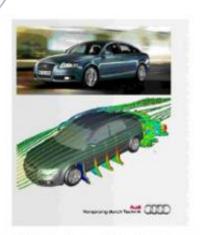

Research

ISP RAS

Web-laboratory UniHUB

Start: 15 march 2011 г.

The goal: Building of Russian scientific community, users of Open Source software

Specialization:

- 1) High-temperature gas dynamics and plasma;
- 2) Multiphase flows and coupled problems of mechanics;
- 3) Projects in the field of space technologies;
- 4) Methods of processing and analysis of Big Data;

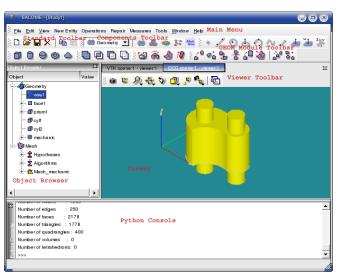

Software: SALOME (*pre-processor*), OpenFOAM (solvers), ParaView (*post-processor*), Dakota, Calculix, Elmer, Incompact3D, NEK5000, BEM++ etc.

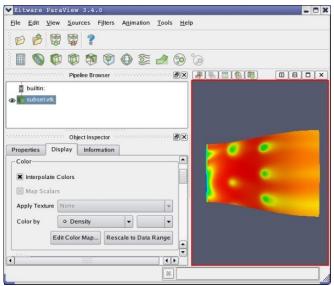

More then 3000 users are registered on 01.09.2015 in Web-Lab UniHUB.

UniCFD group has 930 users

Different solvers in OpenFOAM

\$FOAM_APP/solvers

DNS	basic	combustion
dnsFoam	laplacianFoam, scalarTransportFoam	reactingFoam, fireFoam
compressible	discreteMethods	electromagnetics
sonicFoam, rhoCentralFoam	dsmcFoam	electrostaticFoam
financial	heatTransfer	incompressible
financialFoam	buoyantPimpleFoam, chtMultiRegionFoa	m icoFoam, pisoFoam
lagrangian	multiphase	stressAnalysis
reactingParcelFilmFoam	interFoam, cavitatingFoam	solidDisplacementFoam

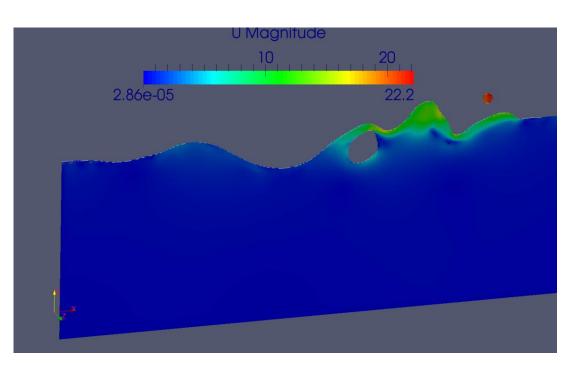

Solver — numerical model for integration of partial differential equations, which is based on finite volume method, written on C++ language

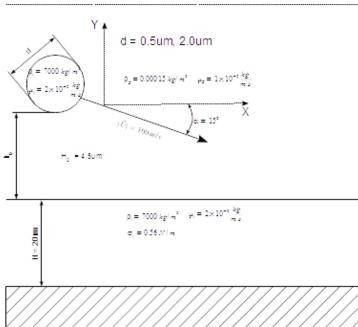

Two different versions of OpenFOAM: www.openfoam.org and www.extend-project.de

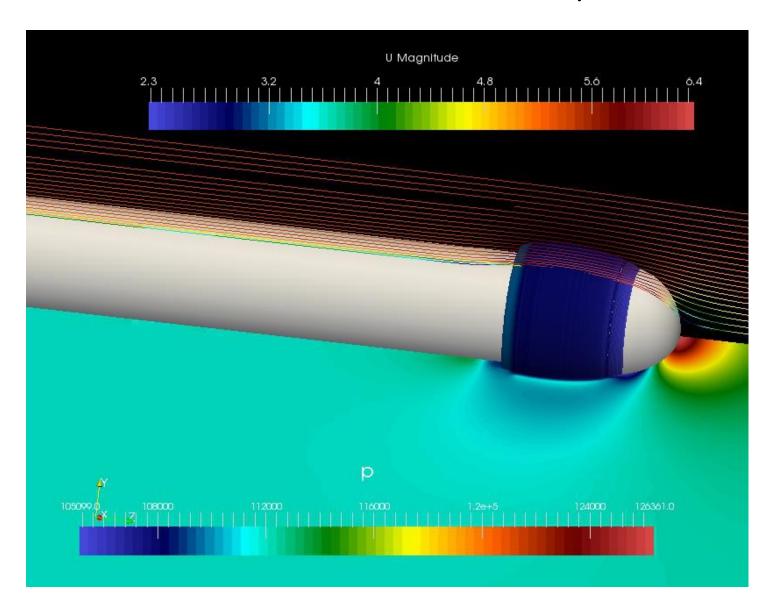

Interaction of liquid metal droplets with liquid layer

Project with ASML company

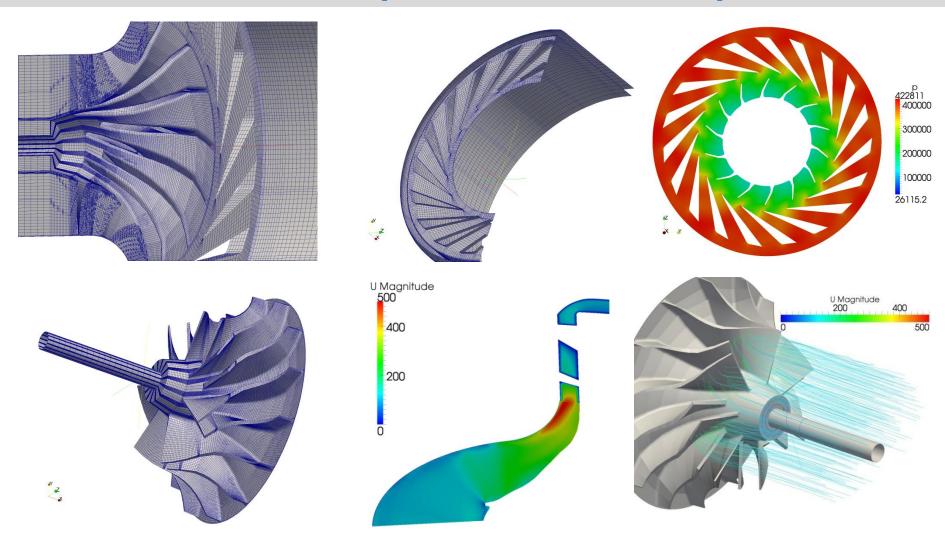

Cavitation with external flow. Blue color shows cavitation cavity.

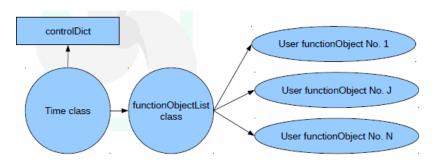

Turbomachinery Flows: Simulation of Supersonic Radial Compressor

Turbulent Flow with LES model. Solver in OpenFOAM: mySonicDyMfoam. Number of cells: 26 111 120

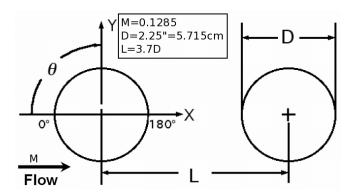

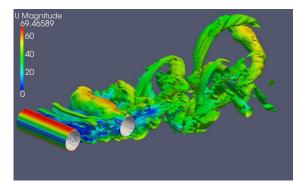

External aerodynamics and computational aeracoustics

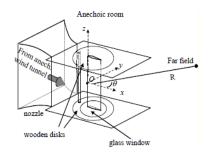

$$p'(\tilde{x},t) = \frac{1}{4\pi c_0} \frac{x_i}{r^2} \left[\frac{\partial F_i}{\partial t} + \frac{c_0 F_i}{r} \right]$$

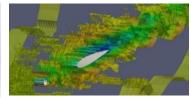

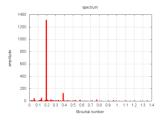

Test case: tandem cylinders

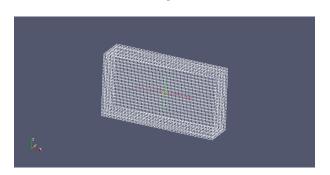

Solver: pisoFoam + LES model + Libacoustics.so library

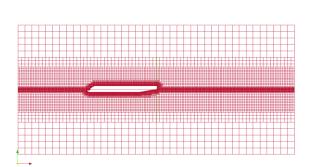

New Project for 2016: Hybrid CAA solver with lagrangianCentralFoam and BEM++

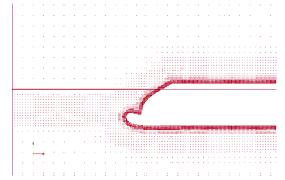

Ship Hydrodynamics

Different Re (Reynolds) and Fr (Froude) numbers.

Solver in OpenFOAM: interFoam + k-omega SST turbulence model

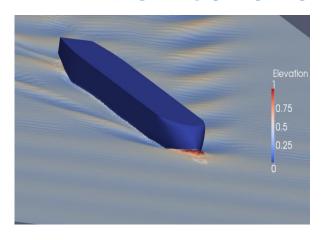

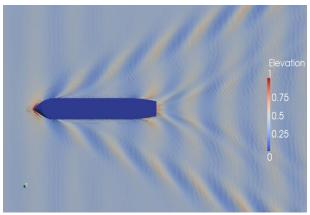

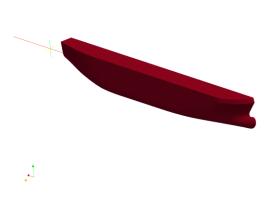

Domain: 1000 m*250 m* 510 m. Lship=6 м.

Number of cells: ~ 4 000 000 - 96 000 000

Definition of forces and moments

Ph.D. Student: N.Tryaskin. Supervisor: Prof. I.V. Tkachenko

Research of droplet impacts on the large Froude numbers

Main goals of research:

- to investigate the possibility of different open-source packages to solve problems of droplet impact;
- to make a numerical research of different regimes of droplet impact to the deep pool or to solid surface with different contact angles.

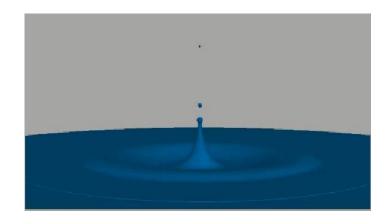

Parts of research:

- investigation of droplet impact to the deep pool;
- investigation of droplet impact to the solid surface with different values of contact angle;
- study of heat transfer effects when droplet falls onto the solid surface.

Range of dimensionless criteria:

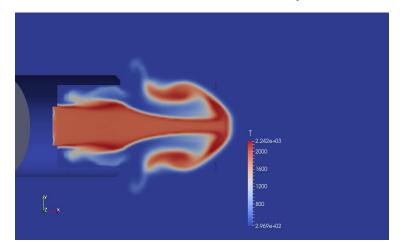

• Fr =
$$\frac{U^2}{gd} > 10^5$$

• Re = $\frac{\rho U d}{\mu} = 400...3000$
• We = $\frac{\rho U^2 d}{\sigma} = 10^2...10^4$

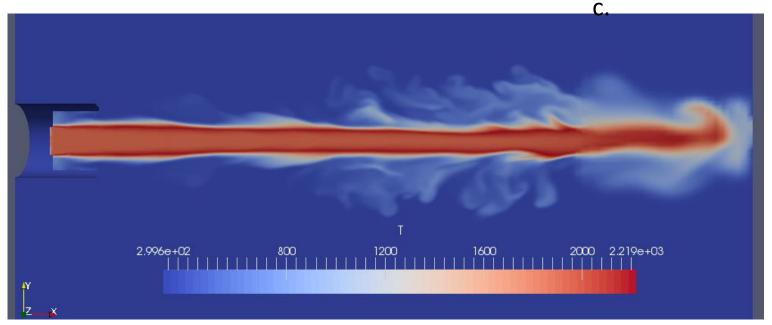

Fields of temperature for solder torch V=10 m/c.

Grid - 8mln. cells. Time T1= 0,001 c.

Grid — 5 mln. cells. Time T1= 0,001

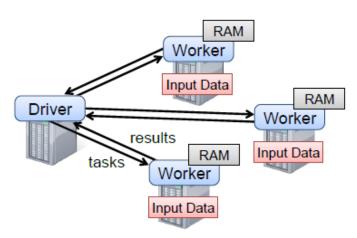

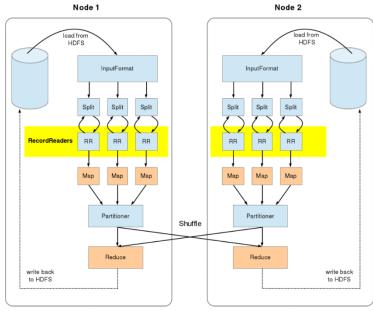

Grid — 8 mln. cells. Time T1 = 0.01 c.

Project: Cluster for analysis of Big Data

- 1) Algorithm POD (Lumley 1970; Sirovich 1987) Proper Ortogonal Decomposition:
 - Simple algorithm which depends from snapshots.
 - SVD decomposition.
 - Orthogonalization in space
- 2) Algorithm DMD (Rowley 2009; Schmid 2010) Dynamic mode decomposition:
 - Time snapshorts.
 - Orthogonalization in time.
- 3) Search and group of data

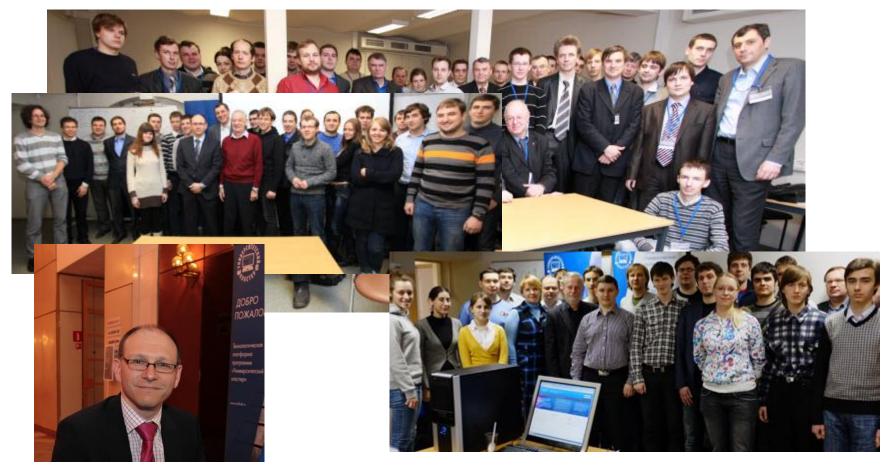

Deployment of Apache Spark cluster in ISP RAS

Hadoop/Mapreduce cluster

Ph.D. student: M. Kalugin Supervisors: Prof. A, Avetisyan, Ph.D. S.Strijhak

Web-laboratory UniCFD=Community

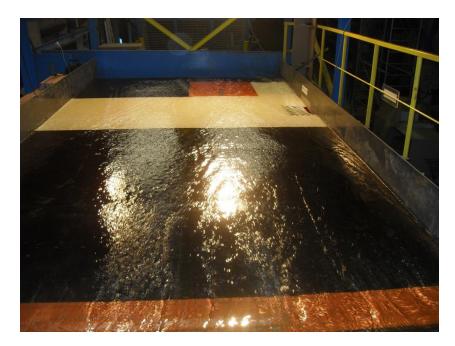

The main goal – creating the community of users and developers

2011-2015: Workshops, Users' trainings, Conferences, Summer schools in Moscow State University (MSU supercomputer Academy)

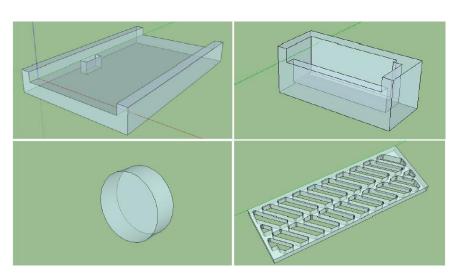

UPC: cfd for urban drainage

Urban Drainage platform - Hydraulics Laboratory in UPC

Ph.D student: Jackson Tellez

Platform Dim: 5.5m x 3m. Flow rate: 100 l/s.

Different conventional Grates

OpenFOAM: interFoam, porousinterFoam

The goal: 3D turbulent flow simulation, definition of velocity fields, pressure drop, flow rate, particle trajectories

New: Possible implementation of PANS (Partially-averaged Navier Stokes) model in OpenFOAM

Experimentas of fractal grates and oscillation grates (UPC, Barcelona, Prof. J.M. Redondo)

Two scale grate

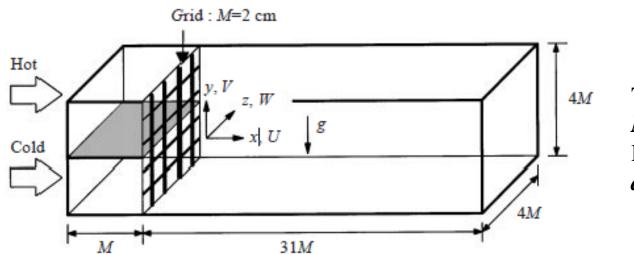

Sierpinski grate

Numerical Domain

The mesh size of grid: $M = 2.0 \times 10e-2 \text{ m}$ Diameter of the rod $d = 3.0 \times 10e-3 \text{ m}$

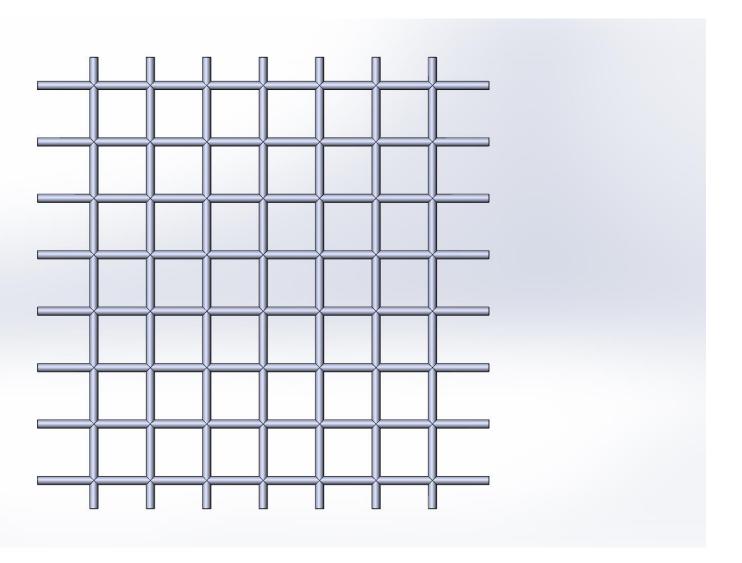

The computational domain was 640x80x80 mm (32M X 4M X 4M) in the streamwise, vertical and spanwise directions

The numbers of grid points used here were 640 x 160 x 160 in the streamwise, vertical and spanwise directions and therefore the grid spacings were 1.0 x 10e-3 m in the streamwise direction and 5.0 x 10e-4 m in the vertical and spanwise directions

A square turbulence-generating grid, on which the velocity components are set to zero, was located 2.0 X 10e-2 m downstream from the entrance

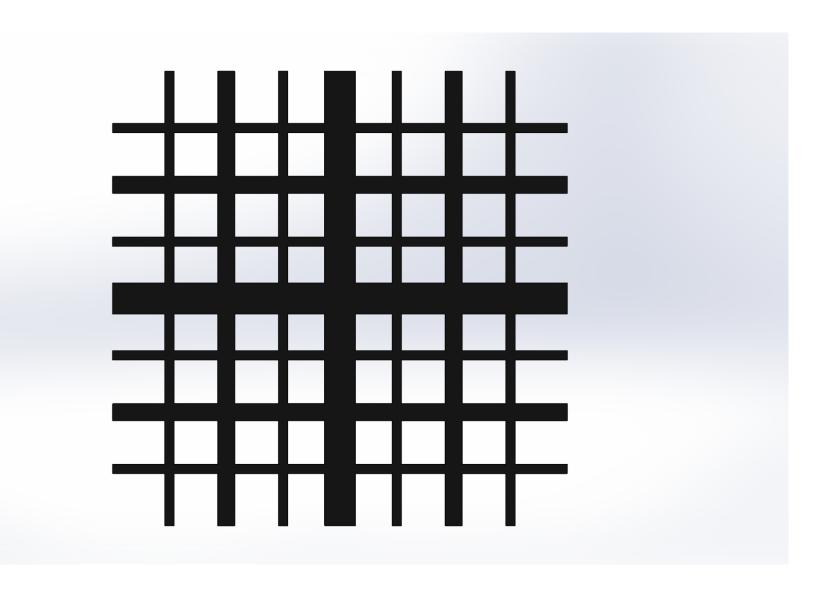

Biplane grid

Fractal Cross grid (T=0.91 M, tmax=62 MM,tmin=18.78MM, W=5 MM)

Turbulence modeling

The Kolmogorov (1941) -5/3 Law

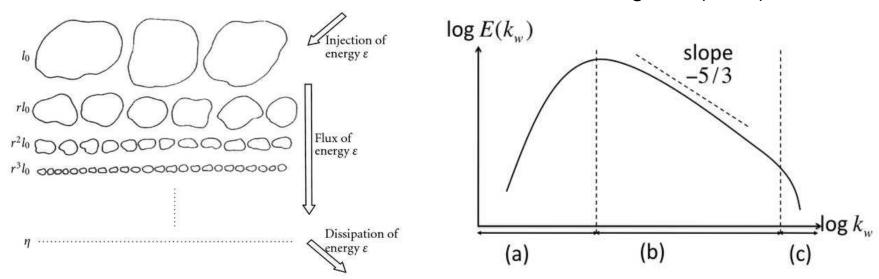

Fig. : Energy cascade and spectrum

- DES is a hybrid LES/RANS approach.
- Zonal approaches, switch the solving equations during the simulation or inside the domain.
- Fixed zonal approach, the RANS zones are defined a priori (close to wall)
- PANS is a hybrid DNS/RANS approach.

Partially-averaged Navier Stokes (PANS) is a suite of turbulence closures of various modeled-to-resolved scale ratios ranging from Reynolds-averaged Navier Stokes (RANS) to Navier-Stokes (Direct Numerical Simulations).

The objective of PANS, like hybrid models, is to resolve large scale structures at reasonable computational expense.

The cut-off lengthscale in PANS is quantified by two parameters: the unresolved-total ratios of kinetic energy (fk) and dissipation (fe).

The unresolved stress is modeled with the Boussinessq approximation and modeled transport equations are solved for the unresolved kinetic energy and dissipation

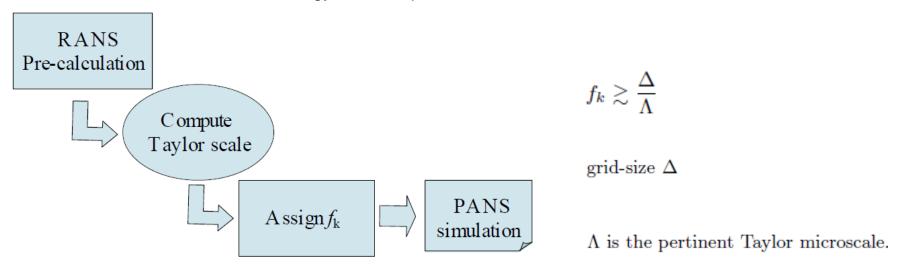

Figure 1. Four-step implementation scheme.

PANS is a hybrid RANS/DNS approach

URANS $k - \varepsilon$ closure equation system

$$\frac{\partial k}{\partial t} + U_j \frac{\partial k}{\partial x_j} = P_k - \varepsilon + \frac{\partial}{\partial x_j} \left[\left(\nu + \frac{\nu_t}{\sigma_k} \right) \frac{\partial k}{\partial x_j} \right]$$

$$\frac{\partial \varepsilon}{\partial t} + U_j \frac{\partial \varepsilon}{\partial x_j} = C_{1\varepsilon} \frac{\varepsilon}{k} (P_k) - C_{2\varepsilon} \frac{\varepsilon^2}{k} + \frac{\partial}{\partial x_j} \left[\left(\nu + \frac{\nu_t}{\sigma_{\varepsilon}} \right) \frac{\partial \varepsilon}{\partial x_j} \right]$$

- $C_{1\varepsilon}=1.44,\ C_{2\varepsilon}=1.92,\ \sigma_{\varepsilon}=1.3\ {\rm and}\ \sigma_{k}=1$
- ν_t is updated every time step as

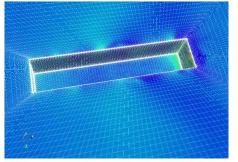

$$\nu_t = C_\mu \frac{k^2}{\epsilon}; \quad C_\mu = 0.09$$

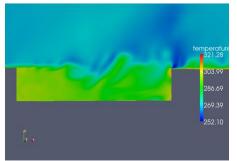

The method can catch only large oscillation such as vortex shedding

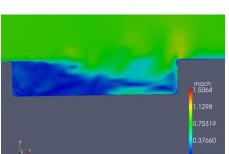

PANS cfd examples

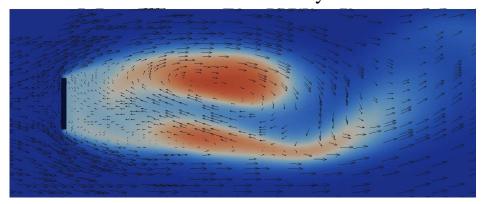

(Chalmers Technology University, Texas A&M University)

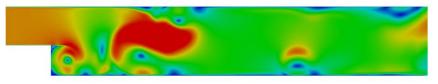

Transonic 3D cavity

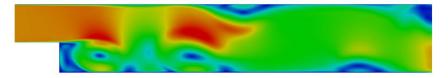

simulation cavitation in 2d flat plate

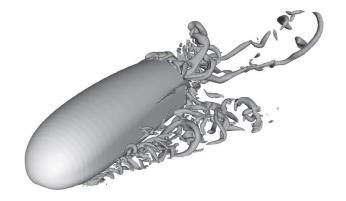

Instantaneous velocity field.

Fixed Fk PANS

Instantaneous velocity field.

varying Fk PANS

flow around generic vehicle

Conclusions

- There is a web laboratory in ISP RAS and we use different Open Source software
- pisoCentralFoam with different modifications is available on github.com
- We try to do a research in fluid dynamics
- We prepared different courses and trainings with Salome/OpenFoam/Paraview
- Deployment of UniHUB in different organizations in Russia
- Our solver is a good start point for scientific collaboration with other different groups!
